A Synthetic Momentum Study for Testing (not a real paper)

Quant AI Researcher

Abstract

This document is invented test material. It describes a monthly cross-sectional momentum rule on a hypothetical equity universe. No number in it is a real result.

1. Introduction

We rank stocks on past twelve-month return, skipping the latest month, and hold the top decile equally weighted, rebalanced monthly.

2. Data

A hypothetical universe of 500 stocks, daily prices, 2010 to 2020.

3. Results

Portfolio	Return (made up)	Volatility (made up)
Top decile	1.0%	5.0%
Bottom decile	0.2%	6.0%

References

None. This is synthetic test material.
